Condenser Tube Bundle Replacement Project

Client/Owner: Florida Power & Light
Project Location: Homestead, Florida

UESI Divers installed stop logs in the discharge Structure's four seal wells, a large concrete structure area that ties into the discharge nozzles of the condenser waterboxes. The stop logs allow the removal of water trapped between the waterboxes and the seal wells, so that in the near future, crews can clean, and/ or possibly replace corroded flange piping on the discharge. The installation was performed in advance of a discharge flange inspection set to occur later in the outage

Completion Date: December 2012
